# Section 1: Executive Summary

The following project involves producing a web application for a Not For Profit (NFP) Organisation that works around promoting climate action and environmental sustainability in local and underrepresented communities. This project focuses on Environmental Education and Climate Literacy, helping customers through two primary methods.

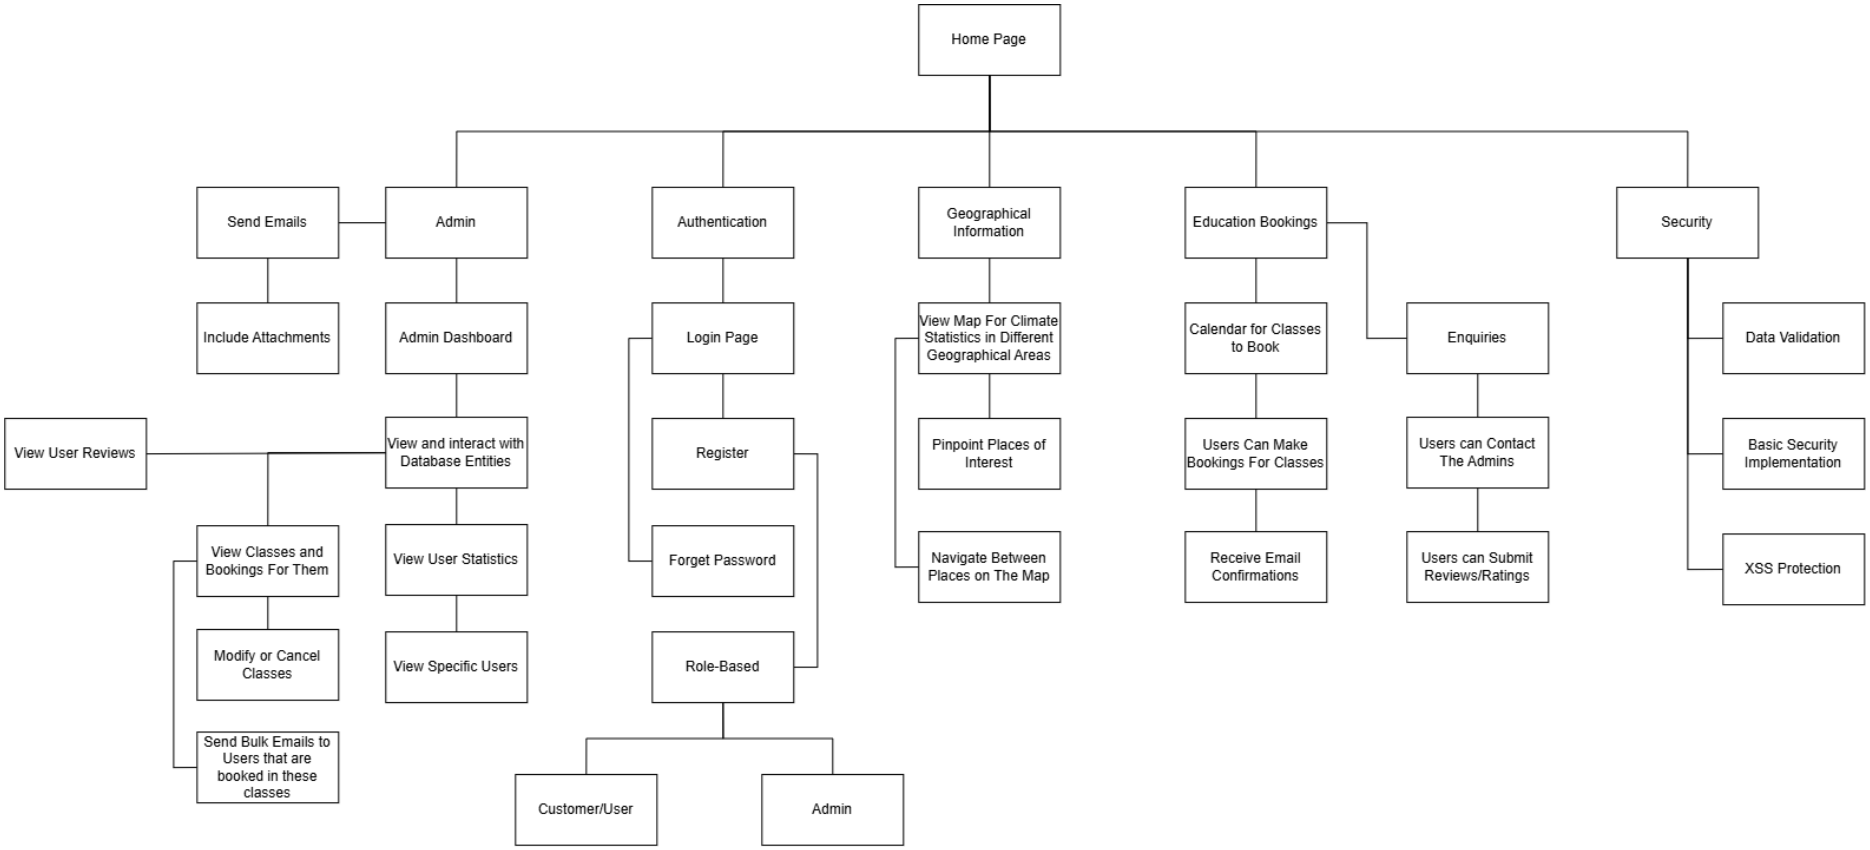

One is by providing insightful information through a map that pinpoints areas where climate is important to analyse and evaluate. This would involve traversing the map and pressing on points of interest to receive text bubbles about them.

The other way is by booking spots in online Climate Literacy classes that help educate customers about climate resilience and environmental protection, and particularly about how innovative technology solutions can help benefit vulnerable groups and underrepresented communities.

Climate Literacy involves learning about the foundation of understanding the greenhouse effect and how humans affect climate change, providing insights into how people can assess their own surrounding environment. The greenhouse effect is where the Earth's atmosphere uses its gas composition to trap heat that travels from the sun. Climate Literacy is important because our current artificial practices are causing more drastic changes in climate, with the Earth's temperature having a gradual increase over the years. Being more informed about how we can use technological solutions for environmental needs means that there can be a focus in sustainable solutions that cause minimal damage without sacrificing economical needs. Understanding the balance between economic and environmental challenges will therefore be a key focus in Climate Literacy education.

The web application focuses on people who want to be more educated about Climate literacy for their own personal reasons, businesses that help underrepresented communities and climate issues, and these underrepresented communities themselves. Ultimately, the goal that the NPM organisation want to achieve with the web application is to provide a service for their customers that can help educate them more about Climate resilience and climate issues in communities that may need help around this issue and providing insights about technological solutions that can be used to help out in these situations.

# Section 2: Sitemap

# Section 3: User Personas

Persona 1: A university student who wants to learn more about Climate Resilience

**JANE**

- 22 years old
- Student

**ABOUT THE USER**

Jane is a University Student who is interested in Climate Change movements. She aspires to learn more about Climate Change so that she can help contribute to different movements and foundations based around communities that have been affected by Climate Change.

**WANTS AND GOALS**

- To build a stronger education about climate and climate change
- Improve her climate literacy

**DEMOGRAPHICS**

- University Students
- Less-Informed Community When It Comes to Climate Change

**PAIN POINTS**

- Current web app takes too long to load pages
- Currently cannot make bookings for desired times and view details about them
- cannot understand how to view the current climate change cases in a given area

**NEEDS**

- To make bookings so that she can attend Climate Education Sessions
- To view and explore a map so that she can explore climate change in different areas for self-learning
- To view her account details so that she can make any changes to it

Persona 2: A business owner who wants to help different communities in different climate areas

**JOHN**

- 28 years old
- Agriculture Consultant

**ABOUT THE USER**

John works for a business that helps out multiple other businesses, particularly farms, with their agriculture work. He works with multiple communities all around Australia, and this includes the different climates that each community may face.

**WANTS AND GOALS**

- Providing better solutions for his clients around agricultural needs
- Improve his own knowledge where need be around climate literacy

**DEMOGRAPHICS**

- Businesses that provide solutions for other businesses around multiple areas
- Businesses that operate in areas with changing climate
- Businesses that operate in multiple locations of different climates

**PAIN POINTS**

- Can't find a consistent way of checking climate areas geographically
- Sometimes cannot provide the best solutions for other businesses regarding climate resillience

**NEEDS**

- To identify which parts of Australia have what kinds of climates
- To help vulnerable groups by providing solutions to them
- To plan projects based on when certain climates that the respective area could transition into
- To attend Climate Education Sessions to expand his knowledge on Climate Resilience

Persona 3: An administrator for the NFP Organisation

**ALEX**

- 31 years old
- Admin for NFP Organisation

**ABOUT THE USER**

Alex works for the NFP Organisation as an admin that helps manage their datasets. This includes their current setup. He also helps maintain the current system by monitoring for changes and recording all entries. He has the technological knowledge to manage a system on a webpage, including implemented databases.

**WANTS AND GOALS**

- Maintaining a well-built system
- Ensuring that customers have minimal issues with using the system
- Ensuring that they have minimal issues with using the system

**DEMOGRAPHICS**

- Staff members of the NFP Organisation
- Administrators

**PAIN POINTS**

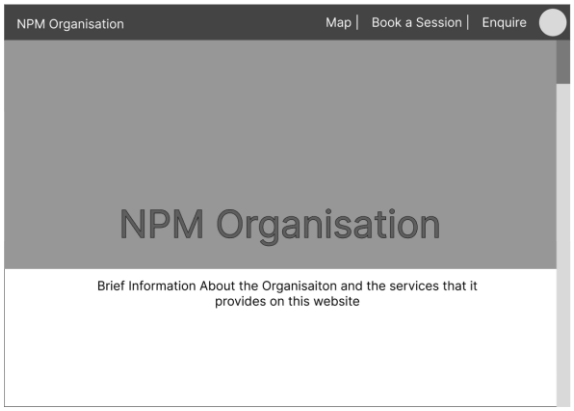

- System takes too long to load up any pages
- It is difficult to manage all of the customers and bookings with the current system

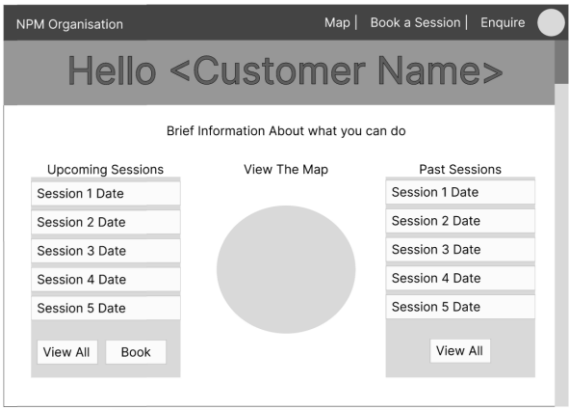

**NEEDS**

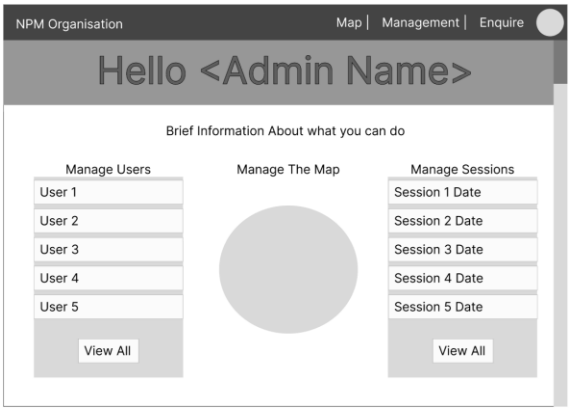

- To have a management page that he can use to manage all customer accounts, alongside clicking on specific entries to view, edit and disable
- To have a similar management page for bookings regarding Climate Literacy classes
- To manage operations regarding the map functionality

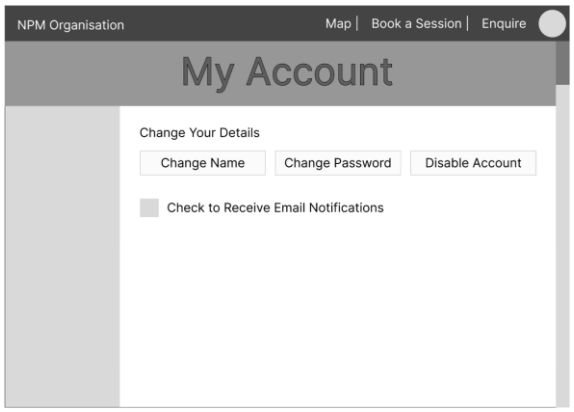

# Section 4: Wireframes/Low-fidelity prototype

The first set of low fidelity wireframe diagrams involve the landing page when no one is logged in, the profile pages when logged in as either a customer or an admin, and the settings page that you can access by pressing the profile icon at the top right (The circle image).

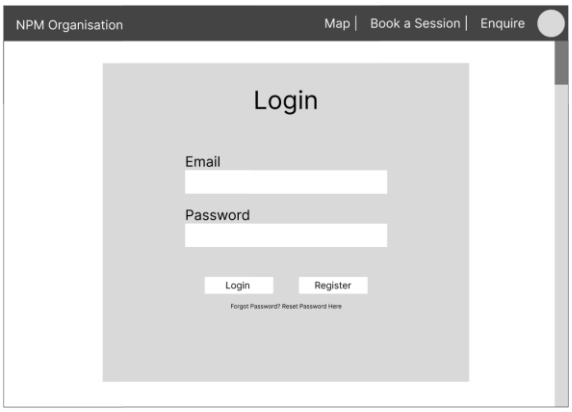

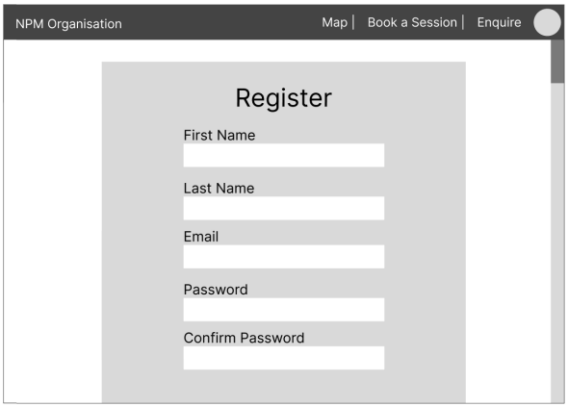

The next set of wireframe diagrams each are grouped up accordingly with one of the business requirements of this project. This totals to three extra groups, as three business requirements (C.1, D.3 and F.1) are the main focal points for the following. The criteria are in Italics for differentiation.

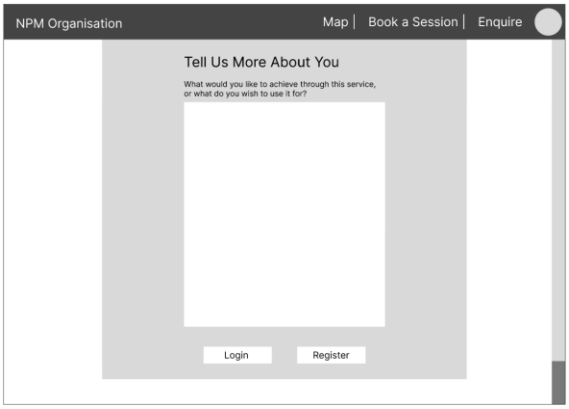

**BR (C.1): Authentication**

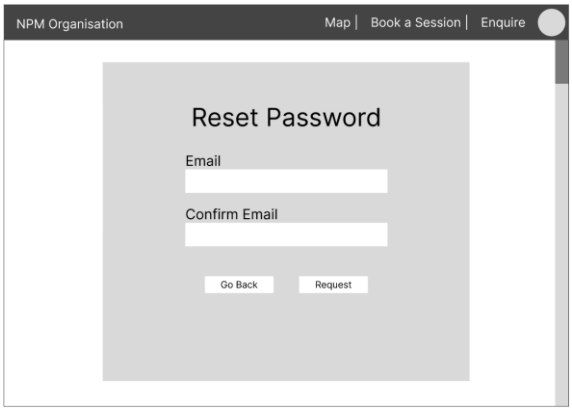

*The new Web Application must have a basic authentication mechanism (login/register functionality and user accounts) to provide confidentiality.*

The user can choose to log into a pre-existing account or register a new account. The registered account will be registered as a customer, as admin accounts are added in via the backend so that only the staff members can add admin accounts. The registration page can be scrolled down, as shown with the two views. A user can also reset a password.

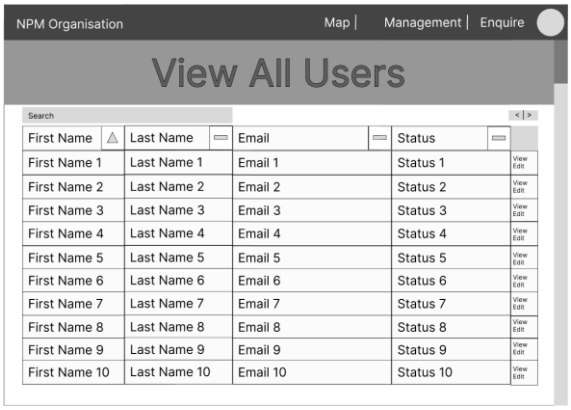

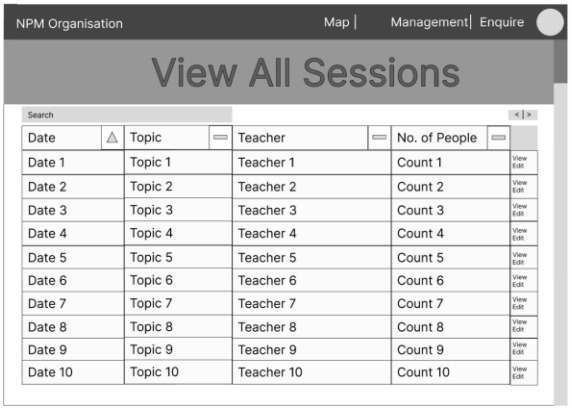

**BR (D.3): Interactive Table Data**

*The new Web Application must display interactive table data with a minimum of two tables. The table needs to support: sort, search and limit to 10 rows per page. User must be able to search by individual column.*

Admin accounts can view all users accounts and all sessions in a table, including viewing and editing them. There is a search functionality and the ability to switch between pages for when there are more than 10 entries.

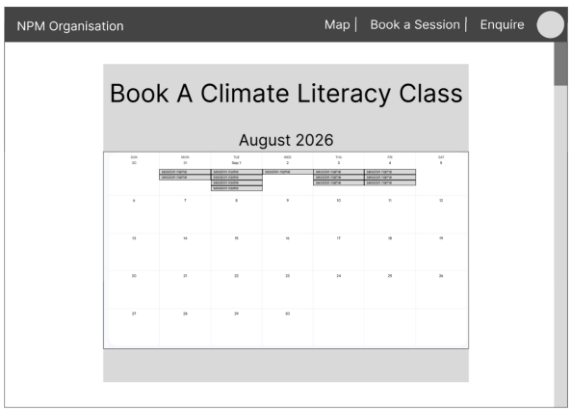

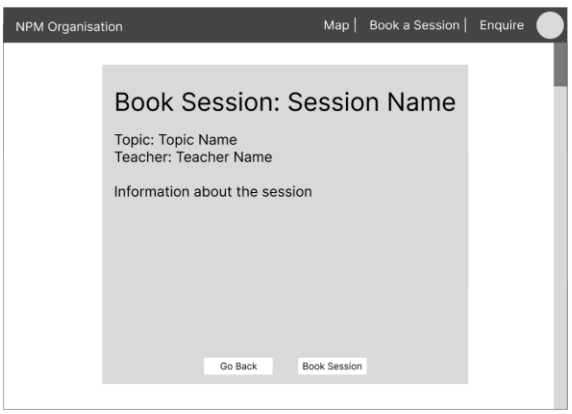

**BR (F.1): Innovation**

*The new Web Application must implement **four** extended innovative features aimed at improving User Experience (UX). A research report with details on which features have been implemented and recommendations for future upgrades **must be prepared** and submitted. Note that implemented innovations may represent enhancements to existing features. Examples of extended innovative features:*

- *Appointment Booking (using Calendar): The new Web Application must implement booking constraints such as booking conflict management using Calendar. **Hint:** Displaying features on a Calendar such as event constraint can be done using FullCalendar.io API*

In this case, the chosen one of the four selected extended innovative features that will be represented in the Wireframe is the Appointment Booking. Customers can book Climate Literacy Class sessions by accessing the calendar. The Calendar shows all available timeslots on a Calendar that shows all dates, grouped by months like a real-world calendar.

## Declaration: Additional Help

| Name | Description |
|---|---|
| Draw.io | Used to create the Site Map for the webpage. A blank canvas was used and the diagram was made from scratch. |
| Canva | User Personas were made using the template in the link below. The template was modified to use a different colour scheme and different subheadings based on the criteria.<br><br>https://www.canva.com/templates/EAEwqjKMvro-user-personas-presentation/ |
| ThisPersonDoesNot Exist | Used for the images for the User Personas<br><br>https://thispersondoesnotexist.com/ |
| Figma | Used for the low fidelity wireframe diagrams. A blank canvas was used and the diagram was made from scratch. |
